fragment is altered so that binding of the encoded altered toxin DNA fragment is altered so that binding of the encoded altered toxin to either the MHZ class II or Teall antigen receptor is altered. Also included are a recombinant DNA construct (comprising a vector and an isolated and purified altered superantigen toxin DNA fragment), a host call transformed with the recombinant DNA construct, producing altered superantigen toxin, an altered TSST-1 (toxic shock syndrome toxin) superantigen toxin, paptide, diagnosing superantigen-associated bacterial infection, a vaccine (comprising an altered superantigen toxin for producing antigenic and immunogenic response resulting in the protection of a mammal against superantigen-associated bacterial infection, an creating/ameliorating a superantigen-associated bacterial infection, an anissera isolated from individuals immunised with one or more altered TSST-1 superantigen toxin and an entibody which recognises altered TSST-1 superantigen toxin and annibody which recognises altered TSST-1. Also disclosed are mutated staphylococcal enterotoxin A, B, CI (SEA, SEB). SECI) and streptococcal pyrogenic enterotoxin a and b (SPEa and composition for treating or preventing bacterial infection. The present sequence represents the ESTQ (with reference to the mature protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A pair of nucleic acids comprising a portion of a long intergenic region (LIR) of a geminivirus genome lacking a sequence encoding a geminiviral coat protein, and a nucleic acid comprising a geminiviral replicase gene linked to a fruit ripening-dependent promoter, are new. Strains of Escherichia coli and Agrobacterium tumefaciens transfected with an expression vector containing the nucleic acids and a gene of interest auseful for the production of transgenic plants (or cells). The sequences and methods are useful for amplifying a gene of interest and overproducing a protein of interest in recombinant plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61 HPWYNDLLVDLGSKDATNKYKGKKVDLYGAYYGYQC-----AGGTPNKTACMYGG 110

hypothetical protein UU495 [imported] - Ureaplasma urealyticum
C;Species: Ureaplasma urealyticum
C;Species: Ureaplasma urealyticum
C;Date: 18-Aug-2000 #sequence_revision 20-Aug-2000 #text_change 20-Aug-2000
C;Accession: F82884
B;Bescription: The complete sequence of Ureaplasma urealyticum: Alternate views of a mini
A;Reference number: A82870
A;Reference number: A82884
A;Reference number: A82884
A;Reterence number: B2003
A;Residues: preliminary
A;Residues: 1-5005 <GLA>

Denicillin-binding protein mecA, low-affinity - Staphylococcus epidermidis
NyAlternate names: penicillin-binding protein 2'
C;Species: Staphylococcus epidermidis
C;Species: Staphylococcus epidermidis
C;Date: 12-Feb-1993 #sequence_revision 12-Feb-1993 #text_change 09-Jul-2004
C;Accession: JQ0774
R;Ryffel, C; Tesch, W.; Birch-Machin, I.; Reynolds, P.E.; Barberis-Maino, L.; Kayser, F.
Gene 94, 137-138, 1990
A;Fitle: Sequence comparison of mecA genes isolated from methicillin-resistant Staphylocc
A;Reference number: JQ0773; MUID:91033056; PMID:2227446
                                                                                                       A;Cross-references: EMBL:X63598; NID:946612; PIDN:CAA45141.1; PID:946613
C;Comment: Enzymes involved in cell wall synthesis are the primary target of beta-lactam
resistant Staphylococcus aureus" (MRSA) has a very low affinity to beta-lactam antibiotic
                                                                                                                                                                                                                                                                                                 A,Note: this resistance gene may have evolved by gene fusion; the amino end (pos 1-60) illin binding proteins from E. coli. The sequence Ser.X-Lys, conserved in penicillin epidding protein part is neither from S. aureus nor from E. coli C;Superfamily: penicillin-binding protein 2B C;Superfamily: penicillin-binding protein 2B C;Keywords: antibiotic resistance; cell wall synthesis F;403/Active site: Ser #status predicted
